

Product Sheet

HAYMAKER

Custom Formulated Foliar Fertilizer

The Science:

HAYMAKER provides a balanced source of nutrition, complete with essential micronutrients that forages require to reach optimum health and yield. It is an excellent, high quality, balanced product used for early season growth, yield development and winter hardiness. Applications of HAYMAKER can also help to increase the overall protein count in forages like alfalfa.

Features:

For use on all forages, including alfalfa and timothy. HAYMAKER is a highly concentrated GEL formulation that provides forages with a quality urea source of N that is critical for early season growth. The availability of K is essential in stimulating nitrogen fixation in alfalfa and helping to prepare the field nutritionally for winter. This in turn increases the overall winter hardiness of the crop resulting in improved spring growth and vigor. Minor nutrients like Boron are key, since they play a critical role in helping to improve flowering and seed set.

Timing:

Forages (including alfalfa and timothy)

- Apply 2.47L per hectare (1L per acre).
- Make the first application 4-6 weeks prior to first cut or as soon as crop is actively growing.
- A second application should be made 7-10 days after 1st cut, or as soon as foliage is actively re-growing.
- To set up the field for winter, make an additional application 14-21 days after 2nd cut.
