

GreenJacket Impermeable over winter turf protection system provides a unique combination of patented products to protect from the harsh effects winter can have on open turf. Being made of a patented combination of high strength, engineered, ultra-durable, layered polymers, the impermeable GreenJacket provides additional protection from ice damage, crown hydration and desiccation.

Complete with reinforced application strips, stakes, washers, vacuum prevention pads and a roll of repair tape the GreenJacket comes complete as a system.

**GreenJacket® PERMEABLE TURF COVERS are the ideal covers for just about every condition.**

When heat is wanted to assist the turf and soil in warming up, the GreenJacket® PERMEABLE turf cover acts with the sun's power to create a greenhouse effect. However, being permeable the cover will allow the turf and soil to breathe but at the same time retain moisture and dramatically increase the sun's ability to heat up the

underlying turf. Perfect for winter protection of crown hydration and desiccation as well as jumpstarting newly established turf and root development, the PERMEABLE covers are also great for overnight Frost Protection, helping to eliminate Tee Time starting delays in the late fall and early spring. GreenJacket® PERMEABLE TURF COVERS are made of an uncoated woven poly material that is UV resistant and will perform for years. Available in Width Increments of 9ft and Length of 5ft.
